

A Darlington restoration specialist is helping churches all over the UK to fight crime and stop the theft of expensive metals. Stone Technical Services and Vipauk are working with a range of ecclesiastical organisations as they tackle the increasing problem of theft of lead, copper and stainless steel roof coverings, roof-flashings, copper lightning conductors and lead rainwater pipes.

Working with Vipa UK Ltd. who have designed and now manufacture the **VIPA DEFENDA UNIT**, which has been specifically designed to combat metal thefts from roofs including churches and historical buildings, the unit can be installed both internally and externally with detection via a supervised snap wire loop which is chemically secured to the valuable lead. Secure communications are used to alert our off site 24 hour monitoring station to the possible intrusion then being passed to key holders or security personnel then the emergency services for a speedy response, the use of CCTV is added to further enhance the detection and deter effect.
